tf.contrib.metrics.streaming_root_mean_squared_error

```
streaming_root_mean_squared_error(
    predictions,
    labels,
    weights=None,
    metrics_collections=None,
    updates_collections=None,
    name=None
)
```

Defined in `tensorflow/contrib/metrics/python/ops/metric_ops.py`.

See the guide: Metrics (contrib) > Metric `Ops`

Computes the root mean squared error between the labels and predictions.

The `streaming_root_mean_squared_error` function creates two local variables, `total` and `count` that are used to compute the root mean squared error. This average is weighted by `weights`, and it is ultimately returned as `root_mean_squared_error`: an idempotent operation that takes the square root of the division of `total` by `count`.

For estimation of the metric over a stream of data, the function creates an `update_op` operation that updates these variables and returns the `root_mean_squared_error`. Internally, a `squared_error` operation computes the element-wise square of the difference between `predictions` and `labels`. Then `update_op` increments `total` with the reduced sum of the product of `weights` and `squared_error`, and it increments `count` with the reduced sum of `weights`.

If `weights` is `None`, weights default to 1. Use weights of 0 to mask values.

Args:

- `predictions`: A `Tensor` of arbitrary shape.
- `labels`: A `Tensor` of the same shape as `predictions`.
- `weights`: Optional `Tensor` indicating the frequency with which an example is sampled. Rank must be 0, or the same rank as `labels`, and must be broadcastable to `labels` (i.e., all dimensions must be either `1`, or the same as the corresponding `labels` dimension).
- `metrics_collections`: An optional list of collections that `root_mean_squared_error` should be added to.
- `updates_collections`: An optional list of collections that `update_op` should be added to.
- `name`: An optional variable_scope name.

Returns:

- `root_mean_squared_error`: A `Tensor` representing the current mean, the value of `total` divided by `count`.
- `update_op`: An operation that increments the `total` and `count` variables appropriately and whose value matches `root_mean_squared_error`.

Raises:

- `ValueError`: If `predictions` and `labels` have mismatched shapes, or if `weights` is not `None` and its shape

doesn't match `predictions`, or if either `metrics_collections` or `updates_collections` are not a list or tuple.
