Class DeviceSpec

Defined in [tensorflow/python/framework/device.py](#).

Represents a (possibly partial) specification for a TensorFlow device.

DeviceSpec s are used throughout TensorFlow to describe where state is stored and computations occur. Using **DeviceSpec** allows you to parse device spec strings to verify their validity, merge them or compose them programmatically.

Example:

```
# Place the operations on device "GPU:0" in the "ps" job.
device_spec = DeviceSpec(job="ps", device_type="GPU", device_index=0)
with tf.device(device_spec):
    # Both my_var and squared_var will be placed on /job:ps/device:GPU:0.
    my_var = tf.Variable(..., name="my_variable")
    squared_var = tf.square(my_var)
```

If a **DeviceSpec** is partially specified, it will be merged with other **DeviceSpec** s according to the scope in which it is defined. **DeviceSpec** components defined in inner scopes take precedence over those defined in outer scopes.

```
with tf.device(DeviceSpec(job="train", )):
    with tf.device(DeviceSpec(job="ps", device_type="GPU", device_index=0)):
        # Nodes created here will be assigned to /job:ps/device:GPU:0.
    with tf.device(DeviceSpec(device_type="GPU", device_index=1)):
        # Nodes created here will be assigned to /job:train/device:GPU:1.
```

A **DeviceSpec** consists of 5 components – each of which is optionally specified:

- Job: The job name.
- Replica: The replica index.
- Task: The task index.
- Device type: The device type string (e.g. "CPU" or "GPU").
- Device index: The device index.

Properties

job

replica

task

Methods

__init__

```
__init__(
    job=None,
    replica=None,
    task=None,
    device_type=None,
    device_index=None
)
```

Create a new **DeviceSpec** object.

Args:

- **job** : string. Optional job name.
- **replica** : int. Optional replica index.
- **task** : int. Optional task index.
- **device_type** : Optional device type string (e.g. "CPU" or "GPU")
- **device_index** : int. Optional device index. If left unspecified, device represents 'any' device_index.

from_string

```
@staticmethod
from_string(spec)
```

Construct a **DeviceSpec** from a string.

Args:

- **spec** : a string of the form /job:/replica:/task:/device:CPU: or /job:/replica:/task:/device:GPU: as cpu and gpu are mutually exclusive. All entries are optional.

Returns:

A DeviceSpec.

merge_from

```
merge_from(dev)
```

Merge the properties of "dev" into this **DeviceSpec** .

Args:

- `dev` : a `DeviceSpec` .

parse_from_string

```
parse_from_string(spec)
```

Parse a `DeviceSpec` name into its components.

Args:

- `spec` : a string of the form `/job:/replica:/task:/device:CPU:` or `/job:/replica:/task:/device:GPU:` as `cpu` and `gpu` are mutually exclusive. All entries are optional.

Returns:

The `DeviceSpec` .

Raises:

- `ValueError` : if the spec was not valid.

to_string

```
to_string()
```

Return a string representation of this `DeviceSpec` .

Returns:

a string of the form `/job:/replica:/task:/device::`.
