

tf.losses.compute_weighted_loss

```
compute_weighted_loss(  
    losses,  
    weights=1.0,  
    scope=None,  
    loss_collection=tf.GraphKeys.LOSSES,  
    reduction=Reduction.SUM_BY_NONZERO_WEIGHTS  
)
```

Defined in [tensorflow/python/ops/losses/losses_impl.py](#).

Computes the weighted loss.

Args:

- **losses**: **Tensor** of shape `[batch_size, d1, ... dN]`.
- **weights**: Optional **Tensor** whose rank is either 0, or the same rank as **losses**, and must be broadcastable to **losses** (i.e., all dimensions must be either 1, or the same as the corresponding **losses** dimension).
- **scope**: the scope for the operations performed in computing the loss.
- **loss_collection**: the loss will be added to these collections.
- **reduction**: Type of reduction to apply to loss.

Returns:

Weighted loss **Tensor** of the same type as **losses**. If **reduction** is **NONE**, this has the same shape as **losses**; otherwise, it is scalar.

Raises:

- **ValueError**: If **weights** is **None** or the shape is not compatible with **losses**, or if the number of dimensions (rank) of either **losses** or **weights** is missing.
