

# tf.train.FinalOpsHook

## Contents

Class FinalOpsHook

Properties

final\_ops\_values

Methods

## Class FinalOpsHook

Inherits From: [SessionRunHook](#)

Defined in [tensorflow/python/training/basic\\_session\\_run\\_hooks.py](#).

See the guide: [Training > Training Hooks](#)

A hook which evaluates **Tensors** at the end of a session.

## Properties

### final\_ops\_values

## Methods

### \_\_init\_\_

```
__init__(  
    final_ops,  
    final_ops_feed_dict=None  
)
```

Initializes **FinalOpHook** with ops to run at the end of the session.

Args:

- final\_ops**: A single **Tensor**, a list of **Tensors** or a dictionary of names to **Tensors**.
- final\_ops\_feed\_dict**: A feed dictionary to use when running **final\_ops\_dict**.

### after\_create\_session

```
after_create_session(  
    session,  
    coord  
)
```

Called when new TensorFlow session is created.

This is called to signal the hooks that a new session has been created. This has two essential differences with the situation in which `begin` is called:

- When this is called, the graph is finalized and ops can no longer be added to the graph.
- This method will also be called as a result of recovering a wrapped session, not only at the beginning of the overall session.

Args:

- `session` : A TensorFlow Session that has been created.
- `coord` : A Coordinator object which keeps track of all threads.

## after\_run

```
after_run(  
    run_context,  
    run_values  
)
```

Called after each call to `run()`.

The `run_values` argument contains results of requested ops/tensors by `before_run()`.

The `run_context` argument is the same one send to `before_run` call. `run_context.request_stop()` can be called to stop the iteration.

If `session.run()` raises any exceptions then `after_run()` is not called.

Args:

- `run_context` : A `SessionRunContext` object.
- `run_values` : A `SessionRunValues` object.

## before\_run

```
before_run(run_context)
```

Called before each call to `run()`.

You can return from this call a `SessionRunArgs` object indicating ops or tensors to add to the upcoming `run()` call. These ops/tensors will be run together with the ops/tensors originally passed to the original `run()` call. The run args you return can also contain feeds to be added to the `run()` call.

The `run_context` argument is a `SessionRunContext` that provides information about the upcoming `run()` call: the originally requested op/tensors, the TensorFlow Session.

At this point graph is finalized and you can not add ops.

Args:

- `run_context` : A `SessionRunContext` object.

Returns:

None or a `SessionRunArgs` object.

## begin

```
begin()
```

Called once before using the session.

When called, the default graph is the one that will be launched in the session. The hook can modify the graph by adding new operations to it. After the `begin()` call the graph will be finalized and the other callbacks can not modify the graph anymore. Second call of `begin()` on the same graph, should not change the graph.

## end

```
end(session)
```
