

tf.contrib.metrics.accuracy

```
accuracy(  
    predictions,  
    labels,  
    weights=None,  
    name=None  
)
```

Defined in [tensorflow/contrib/metrics/python/metrics/classification.py](#).

See the guide: [Metrics \(contrib\)](#) > Metric **Ops**

Computes the percentage of times that predictions matches labels.

Args:

- **predictions** : the predicted values, a **Tensor** whose dtype and shape matches 'labels'.
- **labels** : the ground truth values, a **Tensor** of any shape and bool, integer, or string dtype.
- **weights** : None or **Tensor** of float values to reweight the accuracy.
- **name** : A name for the operation (optional).

Returns:

Accuracy **Tensor** .

Raises:

- **ValueError** : if dtypes don't match or if dtype is not bool, integer, or string.
