

## tf.segment\_sum

```
segment_sum(
    data,
    segment_ids,
    name=None
)
```

Defined in `tensorflow/python/ops/gen_math_ops.py`.

See the guide: [Math > Segmentation](#)

Computes the sum along segments of a tensor.

Read [the section on segmentation](#) for an explanation of segments.

Computes a tensor such that  $output_i = \sum_j data_j$  where sum is over  $j$  such that `segment_ids[j] == i`.

If the sum is empty for a given segment ID  $i$ , `output[i] = 0`.

segment\_ids

data

Args:

- `data`: A **Tensor**. Must be one of the following types: `float32`, `float64`, `int64`, `int32`, `uint8`, `uint16`, `int16`, `int8`, `complex64`, `complex128`, `qint8`, `quint8`, `qint32`, `half`.
- `segment_ids`: A **Tensor**. Must be one of the following types: `int32`, `int64`. A 1-D tensor whose rank is equal to the rank of `data`'s first dimension. Values should be sorted and can be repeated.
- `name`: A name for the operation (optional).

Returns:

A **Tensor**. Has the same type as `data`. Has same shape as data, except for dimension 0 which has size `k`, the number of segments.
