

tf.contrib.framework.assign_from_values

```
assign_from_values(var_names_to_values)
```

Defined in [tensorflow/contrib/framework/python/ops/variables.py](#).

See the guide: [Framework \(contrib\) > Variables](#)

Creates an assignment operation from a given mapping.

This function provides a mechanism for performing assignment of variables to values in a way that does not fill the graph with large assignment values.

Args:

- `var_names_to_values`: A map from variable names to values.

Returns:

- `assign_op`: An **Operation** that assigns each of the given variables to the requested values.
- `feed_dict`: The feed dictionary to use when evaluating `assign_op`.

Raises:

- **ValueError**: if any of the given variable names were not found.
