

## tf.decode\_base64

```
decode_base64(  
    input,  
    name=None  
)
```

Defined in `tensorflow/python/ops/gen_string_ops.py`.

See the guide: [Strings > Conversion](#)

Decode web-safe base64-encoded strings.

Input may or may not have padding at the end. See `EncodeBase64` for padding. Web-safe means that input must use `-` and `_` instead of `+` and `/`.

## Args:

- `input`: A `Tensor` of type `string`. Base64 strings to decode.
- `name`: A name for the operation (optional).

## Returns:

A `Tensor` of type `string`. Decoded strings.
