

tf.errors.CancelledError

Contents

Class CancelledError

Properties

`error_code`

`message`

Class **CancelledError**

Inherits From: [OpError](#)

Defined in [tensorflow/python/framework/errors_impl.py](#).

See the guide: [Running Graphs > Error classes and convenience functions](#)

Raised when an operation or step is cancelled.

For example, a long-running operation (e.g. [tf.QueueBase.enqueue](#) may be cancelled by running another operation (e.g. [tf.QueueBase.close](#), or by [tf.Session.close](#). A step that is running such a long-running operation will fail by raising **CancelledError**.

Properties

error_code

The integer error code that describes the error.

message

The error message that describes the error.

node_def

The **NodeDef** proto representing the op that failed.

op

The operation that failed, if known.

N.B. If the failed op was synthesized at runtime, e.g. a **Send** or **Recv** op, there will be no corresponding [tf.Operation](#) object. In that case, this will return **None**, and you should instead use the [tf.OpError.node_def](#) to discover information about the op.

Returns:

The **Operation** that failed, or None.

Methods

`__init__`

```
__init__(
    node_def,
    op,
    message
)
```

Creates a **CancelledError**.
