

tf.random_shuffle

```
random_shuffle(  
    value,  
    seed=None,  
    name=None  
)
```

Defined in [tensorflow/python/ops/random_ops.py](#).

See the guide: [Constants, Sequences, and Random Values > Random Tensors](#)

Randomly shuffles a tensor along its first dimension.

The tensor is shuffled along dimension 0, such that each `value[j]` is mapped to one and only one `output[i]`. For example, a mapping that might occur for a 3x2 tensor is:

```
[[1, 2],    [[5, 6],  
 [3, 4], ==> [1, 2],  
 [5, 6]]    [3, 4]]
```

Args:

- `value`: A Tensor to be shuffled.
- `seed`: A Python integer. Used to create a random seed for the distribution. See [tf.set_random_seed](#) for behavior.
- `name`: A name for the operation (optional).

Returns:

A tensor of same shape and type as `value`, shuffled along its first dimension.
