

## tf.get\_seed

```
get_seed(op_seed)
```

Defined in [tensorflow/python/framework/random\\_seed.py](#).

See the guide: [Building Graphs > Defining new operations](#)

Returns the local seeds an operation should use given an op-specific seed.

Given operation-specific seed, `op_seed`, this helper function returns two seeds derived from graph-level and op-level seeds. Many random operations internally use the two seeds to allow user to change the seed globally for a graph, or for only specific operations.

For details on how the graph-level seed interacts with op seeds, see [tf.set\\_random\\_seed](#).

## Args:

- `op_seed`: integer.

## Returns:

A tuple of two integers that should be used for the local seed of this operation.
