

## tf.contrib.distributions.bijectors.Sigmoid

## Contents

Class Sigmoid

Properties

dtype

event\_ndims

Class **Sigmoid**Inherits From: **Bijector**Defined in `tensorflow/contrib/distributions/python/ops/bijectors/sigmoid_impl.py`.Bijector which computes  $Y = g(X) = 1 / (1 + \exp(-X))$ .

## Properties

**dtype**dtype of **Tensor**s transformable by this distribution.**event\_ndims**

Returns then number of event dimensions this bijector operates on.

**graph\_parents**Returns this **Bijector**'s graph\_parents as a Python list.**is\_constant\_jacobian**

Returns true iff the Jacobian is not a function of x.

★ **Note:** Jacobian is either constant for both forward and inverse or neither.

Returns:

- `is_constant_jacobian`: Python **bool**.

**name**Returns the string name of this **Bijector**.

## validate\_args

Returns True if Tensor arguments will be validated.

## Methods

---

### \_\_init\_\_

```
__init__(
    validate_args=False,
    name='sigmoid'
)
```

### forward

```
forward(
    x,
    name='forward'
)
```

Returns the forward **Bijector** evaluation, i.e.,  $X = g(Y)$ .

Args:

- **x**: **Tensor** . The input to the "forward" evaluation.
- **name**: The name to give this op.

Returns:

**Tensor** .

Raises:

- **TypeError**: if **self.dtype** is specified and **x.dtype** is not **self.dtype** .
- **NotImplementedError**: if **\_forward** is not implemented.

### forward\_event\_shape

```
forward_event_shape(input_shape)
```

Shape of a single sample from a single batch as a **TensorShape** .

Same meaning as **forward\_event\_shape\_tensor** . May be only partially defined.

Args:

- **input\_shape**: **TensorShape** indicating event-portion shape passed into **forward** function.

Returns:

- **forward\_event\_shape\_tensor**: **TensorShape** indicating event-portion shape after applying **forward** . Possibly

unknown.

## forward\_event\_shape\_tensor

```
forward_event_shape_tensor(  
    input_shape,  
    name='forward_event_shape_tensor'  
)
```

Shape of a single sample from a single batch as an `int32` 1D `Tensor`.

Args:

- `input_shape`: `Tensor`, `int32` vector indicating event-portion shape passed into `forward` function.
- `name`: name to give to the op

Returns:

- `forward_event_shape_tensor`: `Tensor`, `int32` vector indicating event-portion shape after applying `forward`.

## forward\_log\_det\_jacobian

```
forward_log_det_jacobian(  
    x,  
    name='forward_log_det_jacobian'  
)
```

Returns both the `forward_log_det_jacobian`.

Args:

- `x`: `Tensor`. The input to the "forward" Jacobian evaluation.
- `name`: The name to give this op.

Returns:

`Tensor`, if this bijector is injective. If not injective this is not implemented.

Raises:

- `TypeError`: if `self.dtype` is specified and `y.dtype` is not `self.dtype`.
- `NotImplementedError`: if neither `_forward_log_det_jacobian` nor `{_inverse, _inverse_log_det_jacobian}` are implemented, or this is a non-injective bijector.

## inverse

```
inverse(  
    y,  
    name='inverse'  
)
```

Returns the inverse **Bijector** evaluation, i.e.,  $X = g^{-1}(Y)$ .

Args:

- **y**: **Tensor** . The input to the "inverse" evaluation.
- **name**: The name to give this op.

Returns:

**Tensor** , if this bijector is injective. If not injective, returns the k-tuple containing the unique **k** points **(x1, ..., xk)** such that **g(xi) = y** .

Raises:

- **TypeError**: if **self.dtype** is specified and **y.dtype** is not **self.dtype** .
- **NotImplementedError**: if **\_inverse** is not implemented.

## inverse\_event\_shape

```
inverse_event_shape(output_shape)
```

Shape of a single sample from a single batch as a **TensorShape** .

Same meaning as **inverse\_event\_shape\_tensor** . May be only partially defined.

Args:

- **output\_shape**: **TensorShape** indicating event-portion shape passed into **inverse** function.

Returns:

- **inverse\_event\_shape\_tensor**: **TensorShape** indicating event-portion shape after applying **inverse** . Possibly unknown.

## inverse\_event\_shape\_tensor

```
inverse_event_shape_tensor(  
    output_shape,  
    name='inverse_event_shape_tensor'  
)
```

Shape of a single sample from a single batch as an **int32** 1D **Tensor** .

Args:

- **output\_shape**: **Tensor** , **int32** vector indicating event-portion shape passed into **inverse** function.
- **name**: name to give to the op

Returns:

- **inverse\_event\_shape\_tensor**: **Tensor** , **int32** vector indicating event-portion shape after applying **inverse** .

## inverse\_log\_det\_jacobian

```
inverse_log_det_jacobian(  
    y,  
    name='inverse_log_det_jacobian'  
)
```

Returns the  $(\log \circ \det \circ \text{Jacobian} \circ \text{inverse})(y)$ .

Mathematically, returns:  $\log(\det(dX/dY))(Y)$ . (Recall that:  $X=g^{-1}(Y)$ .)

Note that `forward_log_det_jacobian` is the negative of this function, evaluated at  $g^{-1}(y)$ .

Args:

- `y`: `Tensor`. The input to the "inverse" Jacobian evaluation.
- `name`: The name to give this op.

Returns:

`Tensor`, if this bijector is injective. If not injective, returns the tuple of local log det Jacobians,  $\log(\det(Dg_i^{-1}(y)))$ , where  $g_i$  is the restriction of  $g$  to the  $i$ th partition  $D_i$ .

Raises:

- `TypeError`: if `self.dtype` is specified and `y.dtype` is not `self.dtype`.
- `NotImplementedError`: if `_inverse_log_det_jacobian` is not implemented.
