

tf.Assert

```
Assert(  
    condition,  
    data,  
    summarize=None,  
    name=None  
)
```

Defined in [tensorflow/python/ops/control_flow_ops.py](#).

See the guide: [Control Flow > Debugging Operations](#)

Asserts that the given condition is true.

If **condition** evaluates to false, print the list of tensors in **data**. **summarize** determines how many entries of the tensors to print.

NOTE: To ensure that Assert executes, one usually attaches a dependency:

```
# Ensure maximum element of x is smaller or equal to 1  
assert_op = tf.Assert(tf.less_equal(tf.reduce_max(x), 1.), [x])  
with tf.control_dependencies([assert_op]):  
    ... code using x ...
```

Args:

- **condition**: The condition to evaluate.
- **data**: The tensors to print out when condition is false.
- **summarize**: Print this many entries of each tensor.
- **name**: A name for this operation (optional).

Returns:

- **assert_op**: An **Operation** that, when executed, raises a **tf.errors.InvalidArgumentError** if **condition** is not true.

NOTE The output of this function should be used. If it is not, a warning will be logged. To mark the output as used, call its `.mark_used()` method.
