

tf.contrib.seq2seq.TrainingHelper

Contents

Class `TrainingHelper`

Properties

`batch_size`

`sample_ids_dtype`

Class `TrainingHelper`

Inherits From: `Helper`

Defined in `tensorflow/contrib/seq2seq/python/ops/helper.py`.

See the guide: [Seq2seq Library \(contrib\) > Dynamic Decoding](#)

A helper for use during training. Only reads inputs.

Returned `sample_ids` are the argmax of the RNN output logits.

Properties

`batch_size`

`sample_ids_dtype`

`sample_ids_shape`

Methods

`__init__`

```
__init__(
    inputs,
    sequence_length,
    time_major=False,
    name=None
)
```

Initializer.

Args:

- `inputs`: A (structure of) input tensors.
- `sequence_length`: An int32 vector tensor.
- `time_major`: Python bool. Whether the tensors in `inputs` are time major. If `False` (default), they are assumed to be

batch major.

- `name` : Name scope for any created operations.

Raises:

- `ValueError` : if `sequence_length` is not a 1D tensor.

initialize

```
initialize(name=None)
```

next_inputs

```
next_inputs(  
    time,  
    outputs,  
    state,  
    name=None,  
    **unused_kwargs  
)
```

`next_inputs_fn` for `TrainingHelper`.

sample

```
sample(  
    time,  
    outputs,  
    name=None,  
    **unused_kwargs  
)
```
