

## tf.keras.models.save\_model

```
save_model(  
    model,  
    filepath,  
    overwrite=True,  
    include_optimizer=True  
)
```

Defined in [tensorflow/python/keras/\\_impl/keras/models.py](#).

Save a model to a HDF5 file.

The saved model contains: - the model's configuration (topology) - the model's weights - the model's optimizer's state (if any)

Thus the saved model can be reinstantiated in the exact same state, without any of the code used for model definition or training.

### Arguments:

- `model` : Keras model instance to be saved.
- `filepath` : String, path where to save the model.
- `overwrite` : Whether we should overwrite any existing model at the target location, or instead ask the user with a manual prompt.
- `include_optimizer` : If True, save optimizer's state together.

### Raises:

- `ImportError` : if h5py is not available.
