

tf.contrib.framework.nest.assert_same_structure

```
assert_same_structure(  
    nest1,  
    nest2,  
    check_types=True  
)
```

Defined in [tensorflow/python/util/nest.py](#).

Asserts that two structures are nested in the same way.

Args:

- `nest1` : an arbitrarily nested structure.
- `nest2` : an arbitrarily nested structure.
- `check_types` : if **True** (default) types of sequences are checked as well, including the keys of dictionaries. If set to **False**, for example a list and a tuple of objects will look the same if they have the same size.

Raises:

- **ValueError** : If the two structures do not have the same number of elements or if the two structures are not nested in the same way.
- **TypeError** : If the two structures differ in the type of sequence in any of their substructures. Only possible if `check_types` is **True**.
