tf.contrib.data.unbatch

```
unbatch()
```

Defined in **tensorflow/contrib/data/python/ops/batching.py** .

A Transformation which splits the elements of a dataset.

For example, if elements of the dataset are shaped `[B, a0, a1, ...]` , where `B` may vary from element to element, then for each element in the dataset, the unbatched dataset will contain `B` consecutive elements of shape `[a0, a1, ...]` .

Returns:

A `Dataset` transformation function, which can be passed to `tf.data.Dataset.apply` .
